CP 9 FATE AND BEHAVIOUR IN THE ENVIRONMENT

Use patterns considered in this risk assessment

Table CP 9- 1: Intended application patterns

Crop	Timing of application (range)	Number of applications	Application interval [days]	Maximum label rate per treatment [L/ha]	Application rate per treatment [g/ha]	
					Fluoxastrobin	Prothioconazole
Wheat, rye, triticale*	BBCH 30-69	1-2	14-21	1.5	150	150
Barley, oats*	BBCH 30-61	1-2	14-21	1.25	125	125
Onions**	BBCH 15-47	1-2	10	1.0-1.25	100-125	100-125

* Use in Central Europe; ** Use in Southern Europe

Compounds addressed in this document

In addition to the active substance fluoxastrobin, the degradation products summarised in Table CP 9- 2 are addressed in this document as they were major in environmental fate studies.
In this paragraph the approach to the risk assessment of the Z-isomer of fluoxastrobin is specifically considered. The chemical structure of fluoxastrobin contains an oxime ether moiety. Due to the substitution pattern of that double bond E- and Z-isomers exist. The common name fluoxastrobin denotes the *E*-isomer. The Z-isomer is known to be an impurity in technical fluoxastrobin (specification limit 2 mg/kg). The Z-isomer can be formed from the E-isomer by photolytic processes exclusively. The transformation will lead to an equilibrium state in which the E-isomer is the more stable and energetically preferred isomer (ratio in aqueous solution about 10:1 = E / Z). In the environment the Z-isomer shows very similar degradation behaviour and a better soil sorption than the E-isomer. Further, the Z-isomer shows a very similar toxicological profile, A study with *Daphnia magna* performed with an increased amount of Z-Isomer (isomer ratio (E/Z) = 65/35 demonstrated an at least comparable, potentially lower ecotoxicological profile than the parent E-isomer, demonstrating that there is no further risk for the aquatic compartment (please refer to CA 8.2.4.1 M-030533-01-1). Taking this information into account, both isomers can be evaluated as sum of E+Z-isomers, providing a conservative environmental risk assessments.

Table CP 9- 2: Active substance and degradation products addressed in this document

Compound / Codes	Chemical Structure	Explanation for Consideration	Considered for
Fluoxastrobin (HEC 5725) **HEC 5725-Z-Isomer**	 	active substance photolytic metabolite	PEC_{soil} PEC_{gw} PEC_{sw} & PEC_{sed} As a worst case approach, the sum of both isomers (Fluoxastrobin E+Z Isomers) is considered for exposure and risk assessment
HEC 5725-carboxylic acid (HEC 7180, M40)			PEC_{soil} PEC_{gw} PEC_{sw} & PEC_{sed}
HEC 5725-E-des-chlorophenyl (HEC 7155, M48)		occurrence in - aerobic soil (>10 %) - water/sediment study (>10 % in water)	PEC_{soil} PEC_{gw} PEC_{sw} & PEC_{sed}
2-chlorophenol (M82)		occurrence in - aerobic soil (>10 %)	PEC_{soil} PEC_{gw} PEC_{sw} & PEC_{sed}

Definition of the residue for risk assessment

For Details please refer to MCA 7.

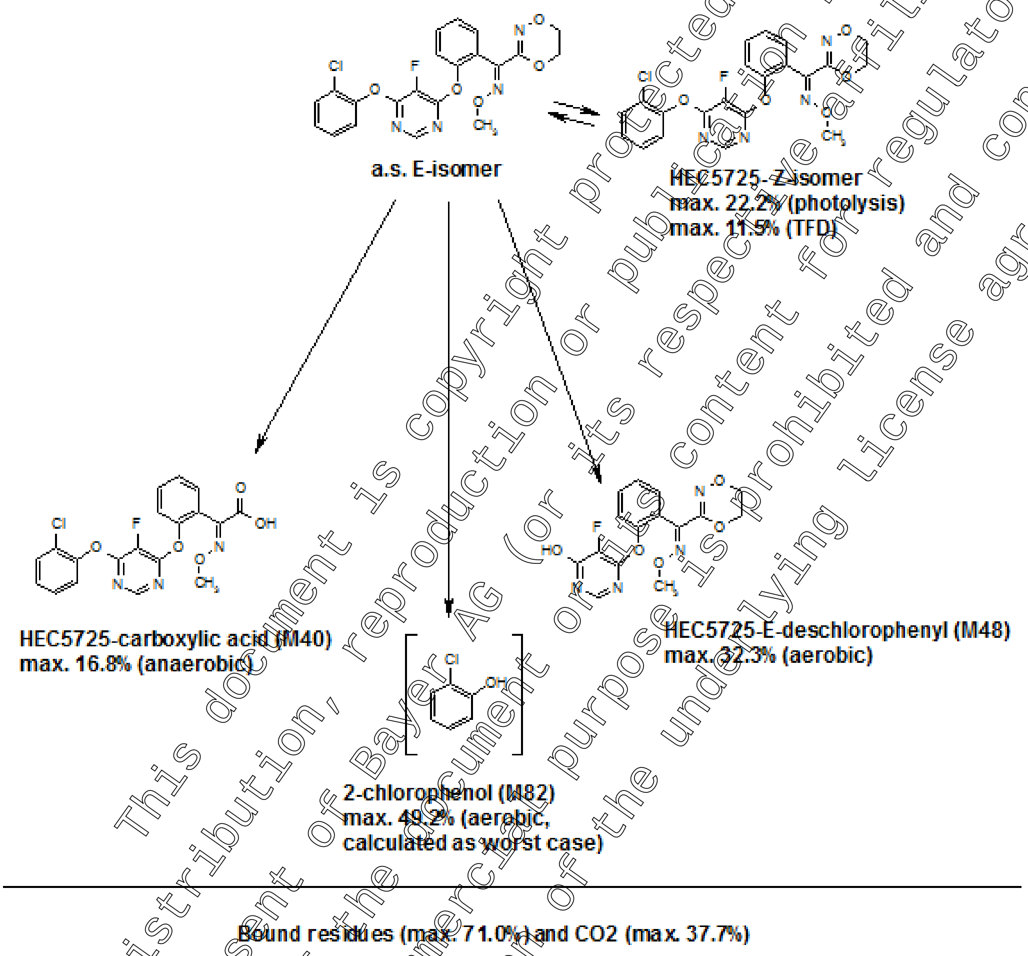
Table CP 9- 3: Definition of the residue for risk assessment

Compartment	Residue Definition for Risk Assessment
Soil	fluoxastrobin (*E*- isomer), HEC 5725 -*Z*-isomer, HEC 5725-carboxylic acid (*M40*), HEC 5725-*E*-des-chlorophenyl (*M48-E*), 2-chlorophenol (*M82*)
Groundwater	fluoxastrobin (*E*-isomer), HEC 5725-*Z*-isomer, HEC 5725-carboxylic acid (*M40*), HEC 5725-*E*-des-chlorophenyl (M48-*E*), 2-chlorophenol (M82)
Surface water	fluoxastrobin (*E*- isomer), HEC 5725-*Z*-isomer, HEC 5725-carboxylic acid (*M40*), HEC 5725-*E*-des-chlorophenyl (*M48-E*)
Sediment	fluoxastrobin (*E*- isomer), HEC 5725-*Z*-isomer
Air	none

CP 9.1 Fate and behaviour in soil

For detailed information on the fate and behaviour in soil please refer to MCA Section 7, data point 7.1.
The proposed degradation pathway of fluoxastrobin in soil is shown in Figure CP 9.1- 1.

Figure CP 9.1- 1: Proposed degradation pathway of fluoxastrobin in soil (major degradation products).



CP 9.1.1 Rate of degradation in soil

No specific studies with the formulation are required. For further information on the fate and behaviour in soil please refer to MCA Section 7, data points 7.1.1 and 7.1.2.

CP 9.1.1.1 Laboratory studies

For information on laboratory studies please refer to MCA Section 7, data point 7.1.2.1.

CP 9.1.1.2 Field studies

For information on field studies please refer to MCA Section 7, data point 7.1.2.2.

CP 9.1.1.2.1 Soil dissipation studies

For information on field dissipation studies please refer to MCA Section 7, data point 7.1.2.2.1.

CP 9.1.1.2.2 Soil accumulation studies

For information on field accumulation studies please refer to MCA Section 7, data point 7.1.2.2.2.

CP 9.1.2 Mobility in the soil

For information on mobility studies please refer to MCA Section 7, data point 7.1.4.

CP 9.1.2.1 Laboratory studies

For information on laboratory studies please refer to MCA Section 7, data point 7.1.4.1

CP 9.1.2.2 Lysimeter studies

For information on lysimeter studies please refer to MCA Section 7, data point 7.1.4.2.

CP 9.1.2.3 Field leaching studies

For information on field leaching studies please refer to MCA Section 7, data point 7.1.4.3.

CP 9.1.3 Estimation of concentrations in soil

New calculations were performed to reflect findings from new studies presented in the active substance dossier, section 7 "Fate and behaviour in the environment". In addition these calculations considered the most recent guidance documents for exposure calculations. Calculations of predicted environmental concentrations in soil (PEC_{soil}) are presented below.

Predicted environmental concentrations in soil (PECs)

Endpoints for PEC_{soil}

For deriving the respective end points please refer to MCA Section 7, data point 7.1.

Table CP 9.1.3- 1: Key modelling input parameters for fluoxastrobin and its metabolites

Compound	Worst case DT_{50} non-normalised [days]		Maximum occurrence in soil [%]	Molar mass [g/mol]	Molar mass correction factor
Fluoxastrobin (E+Z)	DFOP: $k_{1\ fast}$ 0.01741 1/d, $k_{2\ slow}$ 0.002913 1/d, g_{fast} 0.4996 (rates equivalent to: DT_{50} fast phase 39.81 d, DT_{50} slow phase 237.9 d, g_{fast} 0.4996)[5]	(DFOP: $DT_{50\ initial}$ 86.41 d[1], $DT_{90\ initial}$ 552.8 d[1])[5]	100	458.8	1
HEC 5725-E-des-chlorophenyl	95.57[2, 5]		32.2	348.3	0.7592
HEC 5725-carboxylic acid	28.64[3, 6]		16.9	417.8	0.9106
2-chlorophenol	23[4]		49.2[7]	128.56	0.2802

Report:	KCP 9.1.3/01 [redacted],; [redacted]; 2015; M-537905-01-1
Title:	Fluoxastrobin (FXA) and metabolites: PECsoil EUR - Use in cereals and onions in Europe
Report No.:	EnSa-15-0541
Document No.:	M-537905-01-1
Guideline(s):	not applicable
Guideline deviation(s):	not applicable
GLP/GEP:	**no**

Methods and Materials: The predicted environmental concentrations in soil (PEC_{soil}) of fluoxastrobin and its metabolites were estimated based on a first tier approach using a Microsoft® Excel spreadsheet. A bulk density of 1.5 kg/L and a soil mixing depths of 5 cm were used as recommended by FOCUS (1996) and EU Commission (1995, 2000). The accumulation potential of fluoxastrobin after long term use was also assessed, employing the mixing depth of 20 cm for the calculation of the background concentration.
Detailed application data used for simulation of PEC_{soil} were compiled in Table CP 9.1.3- 2.

Table CP 9.1.3- 2: Application pattern used for PEC_{soil} calculations of fluoxastrobin

Individual crop	FOCUS crop used for interception	Application				Amount reaching soil per season application
		Rate per season [g a.s./ha]	Interval [days]	Plant interception [%]	BBCH stage	[g a.s./ha]
Cereals	Cereals	2 × 150	14	2 × 80	2 × 30-69	2 × 30.0
Cereals	Cereals	2 × 125	14	2 × 80	2 × 30-61	2 × 25.0
Onions	Onions	2 × 125	10	2 × 10	2 × 15-47	2 × 112.5

Substance Specific Parameters: The compound specific input parameters (endpoints for PEC_{soil} calculations) are summarized in Table CP 9.1.3- 1.

Findings: The maximum PEC_{soil} values for fluoxastrobin and its metabolites are summarised in Table CP 9.1.3- 3. The maximum, short-term and long-term PEC_{soil} values and the time weighted average values ($TWAC_{soil}$) are provided in tables 9.1.3-4 and 9.1.3-5.

CP 9.2.3 Irradiated water/sediment study

For information on irradiated water/sediment studies please refer to MCA Section 7, data point 7.2.2.4.

CP 9.2.4 Estimation of concentrations in groundwater

Calculations were performed, to reflect findings from new studies presented in the active substance dossier, section 7 "Fate and behaviour in the environment". In addition these calculations consider the most recent guidance documents for exposure calculations.
Calculations of predicted environmental concentrations in groundwater (PEC_{gw}) are presented below.

PEC_{gw} modelling approach

The predicted environmental concentrations in groundwater (PEC_{gw}) for the active substance were calculated using the simulation models FOCUS PEARL and FOCUS PELMO following the recommendations of the FOCUS working group on groundwater scenarios. Further, *where a crop of interest is defined for Châteaudun* scenario, FOCUS MACRO simulations were performed (EFSA Guidance Document, 2014[1]).
The leaching calculations were run over 26 years, as proposed for pesticides which may be applied every year. The first six years are a 'warm up' period; only the last 20 years were considered for the assessment of the leaching potential. The 80th percentile of the mean annual groundwater concentrations in the percolate at 1 m depth under a treated plantation were evaluated and were taken as the relevant PEC_{GW} values. In respect to the assessment of a potential groundwater contamination this shallow depth reflects a worst case. The effective long-term groundwater concentrations will be even lower due to dilution in the upper groundwater layer.
Crop interception will reduce the amount of a compound reaching the soil and therefore this was taken into account depending on the growth stage at application. The interception rates follow the EFSA Guidance Document (2014)[1] recommendations (Table CP 9.2.4- 1).

Table CP 9.2.4- 1: EFSA (2014) groundwater crop interception values

	Crop stage Interception [%]						
Crop	**Bare – emergence**	**Leaf development**	**Stem elongation**		**Flowering**		**Senescence Ripening**
	BBCH						
	00 - 09	**10 - 19**	**20 - 29**	**30 - 39**	**40 - 69**	**70 - 89**	**90 - 99**
Winter cereals	0	0	20 (tillering)	80 (elong.)	90	80	80
Spring cereals	0	0	20 (tillering)	80 (elong.)	90	80	80
Onions	0	10	**20 - 39** 25		**40 - 89** 40		60

Endpoints for PEC_{gw}

For deriving the respective endpoints please refer to MCA7, data point 7.1.

Title:	Fluoxastrobin (FXA) and metabolites: PECgw FOCUS PEARL, PELMO EUR - Use in Onions in Europe
Report No.:	Ensa-15-0551
Document No.:	M-537902-01-1
Guideline(s):	not applicable
Guideline deviation(s):	not applicable
GLP/GEP:	**no**

The predicted environmental concentrations in groundwater (PEC_{gw}) for fluoxastrobin and its metabolites were calculated using the simulation model FOCUS PEARL (version 4.4.4) and FOCUS PELMO (version 5.5.3). Crop interception was taken into account according to the BBCH growth stage, as recommended by EFSA (EFSA (2014), FOCUS (2014)). The absolute dates for applications based on BBCH codes given in the GAP were determined using AppDate2 (Klein (2010)), a German regulatory tool for estimating application dates and crop interception.

Typically, a leaching assessment is carried out considering aerobic conditions as a common agricultural situation. Therefore, observed major aerobic metabolites were taken into account, implementing their amounts and behaviour as observed under aerobic conditions.
However, in anaerobic soil, a further fast degrading major metabolite, HEC5725-carboxylic acid (HEC7180, M40), was identified (16.9 % at day 120), which did not occur under aerobic conditions. Based on these observations, a conservative anaerobic leaching assessment was carried out for this metabolite, respectively.

Anaerobic leaching scenario:

Under common agricultural situations in Europe, considering e.g. climatic conditions or slope of fields, it is obviously unrealistic, that a total treated agricultural field or area turns anaerobic, each year after application and lasting for a long time period, as typically considered for aerobic leaching assessments. Such conditions would make farming effectively impossible.
Therefore, two more realistic, but still very conservative scenarios were considered here:

Scenario 1: Anaerobic conditions may occur regularly in plane fields or cropping areas, when rain water remains in small sinks and furrows with low permeability. In this case, only a relatively small percentage of the total cropped area or field would be affected.

Scenario 2: Anaerobic conditions on larger scale may occur due to flooding along rivers. Typically, this flooding will not occur regularly or each year, only with large time intervals in between.

The following assumptions were made to address these two scenarios. Partly, additional safety factors were applied to address uncertainties in the estimation.

Here, it is implicitly included that anaerobic conditions occur more or less immediately after application (1 day later) and that anaerobic conditions are as strict as simulated in the lab. In reality, it may take considerable time after ponding until anaerobic conditions occur, because the remaining oxygen in soil and water has to be consumed by microbes first. Furthermore, in the lab studies anaerobic conditions are ensured by ventilating the samples with nitrogen. Such conditions will not appear in reality.

Therefore, it has to be noted, that the described assumptions and scenarios are highly conservative.

Table CP 9.2.4.1- 1: Assumptions used for anaerobic leaching scenarios

Scenario	Assumption	Safety factor	actually used
1	not more than 10 % area of an agricultural field becomes anaerobic, every year shortly after application	1	**application rate** reduced to **10 %**, applied **every year** (application rate 100 %, applied every year, PEC_{gw} divided by 10)
2	Calculation base for dimension of levees, dykes and flood plains along rivers are 100-year-floodings. Hence, ponding on larger areas can be assumed to occur in average every 100 years.	10	**application rate 100 %**, applied **every 10 years**
both	Farmer will not apply on saturated and ponded fields. Therefore, it is assumed, that parent compound degrades 1 day under aerobic conditions before anaerobic conditions occur.		degradation time for parent before anaerobic = 1 day
both	Anaerobic conditions usually will not last for longer than 1 week. Maximum occurrence of metabolite might not yet be reached at this time.		maximum occurrence in anaerobic soil of M40 = 16.9% (found after 120 d)
both	After an anaerobic period, normal aerobic agricultural conditions may dominate in soil again. Thus, aerobic degradation of the anaerobic metabolite is assessed.		Aerobic lab DT_{50} of 17.01 d (M40)

Pseudo application of anaerobic metabolite:

The anaerobic metabolite is assumed to be applied directly to the soil by pseudo application. Hence, no "pathway"-calculation was done in which the parent is applied. This is considered the only plausible but conservative way to account for the anaerobic formation (expressed by the maximum occurrence) and the aerobic degradation of the anaerobic metabolite. Applying the aerobic pathway for groundwater calculations may disregard the formation under anaerobic conditions.

Detailed application data used for simulation of PEC_{gw} for all compounds were compiled in Table CP 9.2.4.1- 2.

Table CP 9.2.4.1- 2: Application pattern used for PEC_{gw} calculations

Individual crop	FOCUS crop used for interception	Application				Amount reaching soil per season application [g a.s./ha]

1) Pseudo application pattern for the anaerobic metabolite HEC 5725-carboxylic acid (Scenario 1).

As described for scenario 1, 100 % of the potential pseudo application rate of anaerobic HEC 5725-carboxylic acid was applied, each year. All PEC_{gw} values for all groundwater scenarios and application periods resulted already in concentrations ≤ 0.003 µg/L, also without a division by 10. Therefore, a further simulation according Scenario 2, every 10 years, was not carried out anymore, as it is already covered with the first simulation.

Conclusion: There are no concerns for groundwater from the use of fluoxastrobin in accordance with the use pattern for the representative formulation.

The concentration of the metabolite HEC 5725-E-des-chlorophenyl (M48) was predicted to reach groundwater at concentrations exceeding 0.1 µg/L. However, the relevance of this metabolite was assessed and the metabolite is non-relevant in groundwater (see Document N4).

PEC_{gw} values for the use in cereals and onions – FOCUS MACRO

As recommended by FOCUS (2014), PEC_{gw} were calculated in addition with MACRO 5.5.3, as the Châteaudun scenario has been defined for cereals and onions.

Report:	KCP 9.2.4.1/03 [redacted]; [redacted]; 2015; M-537903-01-1
Title:	Fluoxastrobin (FXA) and metabolites: PECgw FOCUS MACRO 5.5.3 EUR - Use in cereals and onions in Europe
Report No.:	Ensa-15-0546
Document No.:	M-537903-01-1
Guideline(s):	not applicable
Guideline deviation(s):	not applicable
GLP/GEP:	**no**

The predicted environmental concentrations in groundwater (PEC_{gw}) for fluoxastrobin and its metabolites were calculated using the simulation model FOCUS MACRO (version 5.5.3) to simulate macro pore flow for drained soils for Châteaudun scenario. Crop interception was taken into account according to the BBCH growth stage, as recommended by EFSA (EFSA (2014), FOCUS (2014)). The absolute dates for applications based on BBCH codes given in the GAP were determined using AppDate2 ([redacted] (2015)), a German regulatory tool for estimating application dates and crop interception.

Typically, a leaching assessment is carried out considering aerobic conditions as a common agricultural situation. Therefore, observed major aerobic metabolites were taken into account, implementing their amounts and behaviour as observed under aerobic conditions.
However, in anaerobic soil, a further fast degrading major metabolite, HEC5725-carboxylic acid (HEC7180, M40), was identified (16.9 % at day 120), which did not occur under aerobic conditions. Based on these observations, a conservative anaerobic leaching assessment was carried out for this metabolite, respectively.

<u>Anaerobic leaching scenario:</u>

Under common agricultural situations in Europe, considering e.g. climatic conditions or slope of fields, it is obviously unrealistic, that a total treated agricultural field or area turns anaerobic, each year after application and lasting for a long time period, as typically considered for aerobic leaching assessments. Such conditions would make farming effectively impossible.
Therefore, two more realistic, but still very conservative scenarios have been considered here:

Scenario 1: Anaerobic conditions may occur regularly in plane fields or cropping areas, when rain water remains in small sinks and furrows with low permeability. In this case, only a relatively small percentage of the total cropped area or field would be affected.

Scenario 2: Anaerobic conditions on larger scale may occur due to flooding along rivers. Typically, this flooding will not occur regularly or each year, only with large time intervals in between.

The following assumptions have been made to address these two scenarios. Partly, additional safety factors are applied to address uncertainties in the estimation.

Here, it is implicitly included that anaerobic conditions occur more or less immediately after application (1 day later) and that anaerobic conditions are as strict as simulated in the lab. In reality, it may take considerable time after ponding until anaerobic conditions occur, because the remaining oxygen in soil and water has to be consumed by microbes first. Further on, in the lab studies anaerobic conditions are ensured by ventilating the samples with nitrogen. Such conditions will not appear in reality.

Therefore, it has to be noted, that the described assumptions and scenarios are highly conservative.

Table CP 9.2.4.1- 11: Assumptions used for anaerobic leaching scenarios

Scenario	Assumption	Safety factor	actually used
1	not more than 10 % area of an agricultural field becomes anaerobic, every year shortly after application	1	**application rate** reduced to **10 %**, applied **every year** (application rate 100 %, applied every year, PEC_{gw} divided by 10)
2	Calculation base for dimension of levees, dykes and flood plains along rivers are 100-year-floodings. Hence, ponding on larger areas can be assumed to occur in average every 100 years.	10	**application rate 100 %**, applied **every 10 years**
both	Farmer will not apply on saturated and ponded fields. Therefore, it is assumed, that parent compound degrades 1 day under aerobic conditions before anaerobic conditions occur.		degradation time for parent before anaerobic = 1 day
both	Anaerobic conditions usually will not last for longer than 1 week. Maximum occurrence of metabolite might not yet be reached at this time.		maximum occurrence in anaerobic soil of M40 = 16.9% (found after 120 d)
both	After an anaerobic period, normal aerobic agricultural conditions may dominate in soil again. Thus, aerobic degradation of the anaerobic metabolite is assessed.		Aerobic lab DT_{50} of 17.01 d (M40)

Pseudo application of anaerobic metabolite:

The anaerobic metabolite is assumed to be applied directly to the soil by pseudo application. Hence, no "pathway"-calculation was done in which the parent is applied. This is considered the only plausible but conservative way to account for the anaerobic formation (expressed by the maximum occurrence) and the aerobic degradation of the anaerobic metabolite. Applying the aerobic pathway for groundwater calculations may disregard the formation under anaerobic conditions.

Detailed application data used for simulation of PEC_{gw} for all compounds were compiled in Table CP 9.2.4.1- 12.

Table CP 9.2.4.1- 12: Application pattern used for PEC_{gw} calculations

Individual crop	FOCUS crop used for interception	Application				Amount reaching soil per season application [g a.s./ha]
		Rate per season [g a.s. /ha]	Interval [days]	Plant interception [%]	BBCH stage	
Winter & spring cereals, GAP	-	2 × 150	14	-	30-69	-
Spring cereals 1, simulation	Spring cereals	2 × 150	14	2 × 80	30-69	2 × 30.0
Spring cereals 2, simulation 2)	Spring cereals	2 × 22.68 1)	14	2 × 80	30-69	2 × 4.54 1)
Winter cereals 1, simulation	Winter cereals	2 × 150	14	2 × 80	30-69	2 × 30.0
Winter cereals 2, simulation 2)	Winter cereals	2 × 22.68 1)	14	2 × 80	30-69	2 × 4.54 1)

[3)] metabolite formation in MACRO is based on molar masses M and formation fraction:
fconvert = M_{metab} / M_{parent} * formation fraction
[4)] not available, as no formation fraction available; pseudo application used in MACRO

Findings: PEC_{GW} were evaluated as the 80[th] percentile of the mean annual leachate concentration at 1 m soil depth. FOCUS MACRO PEC_{gw} results for fluoxastrobin and its metabolites after application to winter and spring cereals and onions are given in the table below.

Table CP 9.2.4.1- 15: FOCUS MACRO PEC_{gw} results of fluoxastrobin and its metabolites at Chateaudun

Scenario	Fluoxastrobin (E+Z)	HEC 5725-E-des-chlorophenyl	2-chlorophenol	HEC 5725-carboxylic acid[1)]
	PEC_{gw} [µg/L]	PEC_{gw} [µg/L]	PEC_{gw} [µg/L]	PEC_{gw} [µg/L]
Spring cereals 2 × 150 g a.s./ha	<0.001	0.984	<0.001	<0.001
Winter cereals 2 × 150 g a.s./ha	<0.001	1.06	<0.001	<0.001
Spring cereals 2 × 125 g a.s./ha	<0.001	0.811	<0.001	<0.001
Winter cereals 2 × 125 g a.s./ha	<0.001	0.877	<0.001	<0.001
Onions 2 × 125 g a.s./ha	<0.001	3.81	<0.001	<0.001

[1)] Pseudo application pattern for the anaerobic metabolite HEC 5725-carboxylic acid (Scenario 1).

As described for scenario 1, 100 % of the potential pseudo application rate of anaerobic HEC 5725-carboxylic acid was applied, each year. All PEC_{gw} values for all groundwater scenarios and application periods resulted already in concentrations < 0.001 µg/L, also without a division by 10. Therefore, a further simulation according Scenario 2, every 10 years, was not carried out anymore, as it is already covered with the first simulation.

Conclusion: There are no concerns for groundwater from the use of fluoxastrobin in accordance with the use pattern for the representative formulation.

The concentration of the metabolite HEC5725-E-des-chlorophenyl (M48) was predicted to reach groundwater at concentrations exceeding 0.1 µg/L. However, the relevance of this metabolite was assessed and the metabolite is non-relevant in groundwater (see Document N4).

CP 9.2.4.2 Additional field tests

No additional field studies were performed or required due to low PEC_{gw} values calculated (see CP 9.2.4.1).

CP 9.2.5 Estimation of concentrations in surface water and sediment

New calculations were performed, to reflect findings from new studies presented in the active substance dossier, section 7 “Fate and behaviour in the environment”. In addition these calculations consider the most recent guidance documents for exposure calculations. Calculations of predicted environmental concentrations are presented below.

Predicted environmental concentrations in water (PEC_{SW}) and sediment (PEC_{sed})

Endpoints for surface water (PEC_{SW}) and sediment (PEC_{sed})

For deriving the respective end points please refer to MCA Section 7, data point 7.2.

Table CP 9.2.5- 1: Key modelling input parameters for fluoxastrobin and its metabolites at Steps 1-2 level PEC calculations

Report:	KCP 9.2.5/01 [redacted],; [redacted]; 2015; M-537907-01-1
Title:	Fluoxastrobin (FXA) and metabolites: PECsw, sed FOCUS EUR - Use in cereals and onions in Europe
Report No.:	Ensa-15-0571
Document No.:	M-537907-01-1
Guideline(s):	not applicable
Guideline deviation(s):	not applicable
GLP/GEP:	**no**

Materials and Methods: Predicted environmental concentrations in surface water and sediment (PEC_{sw} and PEC_{sed}) of fluoxastrobin and its metabolites were calculated for the use in winter and spring cereals and onions in Europe. All relevant entry routes of a compound into surface water (combination of spray drift and runoff/erosion or drain flow) were considered in these calculations.

At FOCUS Step 2 the application period was set to March to May and the use in Northern and Southern Europe was considered. Details of the application pattern used in the Step 2 calculations are summarised in Table CP 9.2.5- 3.

Table CP 9.2.5- 3: Application pattern used for $PEC_{sw,sed}$ calculations at FOCUS Steps 1&2

Crop	Rate [g a.s./ha]	Interval [days]	BBCH stage	FOCUS crop (crop group)	Season	Crop cover
Cereals, GAP	2 × 150	14	30-69	-		-
Cereals (winter), simulation 1	2 × 150	14	30-69	Winter cereals	Mar. - May	Intermediate crop cover 20 %
Cereals (spring), simulation 2	2 × 150	14	30-69	Spring cereals	Mar. - May	Intermediate crop cover 20 %
Cereals, GAP	2 × 125	14	30-61	-	-	-
Cereals (winter), simulation 1	2 × 125	14	30-61	Winter cereals	Mar. - May	Intermediate crop cover 20 %
Cereals (spring), simulation 2	2 × 125	14	30-61	Spring cereals	Mar. - May	Intermediate crop cover 20 %
Onions, GAP	2 × 125	10	15-47	-	-	-
Onions, simulation	2 × 125	10	15-47	Vegetables, bulb (arable crops)	Mar. - May	Minimal crop cover 10 %

In FOCUS Step 3, the application date for each scenario is determined by the Pesticide Application Timer (PAT), which is part of the FOCUS SW Scenarios. The user may only define an application time window. Absolute application dates for the crop simulation runs were estimated using a German regulatory tool AppDate 2[2]. Details of the parameters used in the Step 3 calculations are summarised in Table CP 9.2.5- 4.

[2] [redacted] 2015: Computer programme: "AppDate: Estimation of application dates based on crop development." (v.2.0b.).

CP 9.3 Fate and behaviour in air

For information on the fate and behaviour in air please refer to MCA Section 7, data point 7.3.

CP 9.3.1 Route and rate of degradation in air and transport via air

For information on route and rate of degradation in air and transport via air please refer to MCA Section 7, data points 7.3.1 and 7.3.2.

Due to the low volatility and short half-life in air no PEC calculations are required.

CP 9.4 Estimation of concentrations for other routes of exposure

There are no other routes of exposure if the product is used according to good agricultural practice. Therefore no further estimations are considered necessary.
